

Front End and Testing

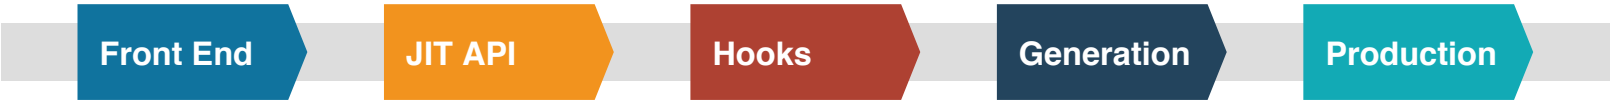

Developer writes a front end application and API tests

Custom Hooks

Hooks made by the developer for custom behaviour/endpoints. JIT config is set to match requirements

Production

The Developer starts an SQL server and launches the project

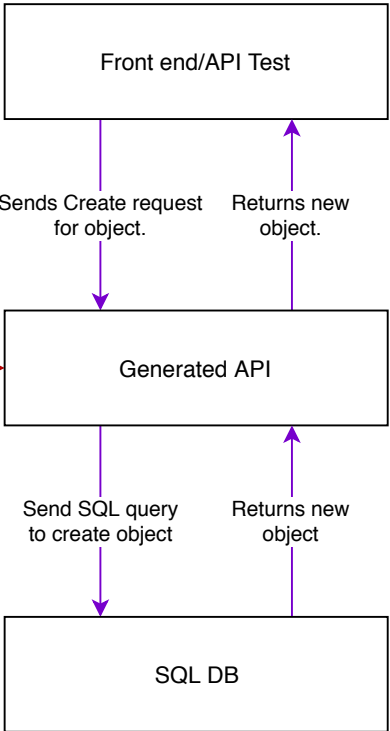

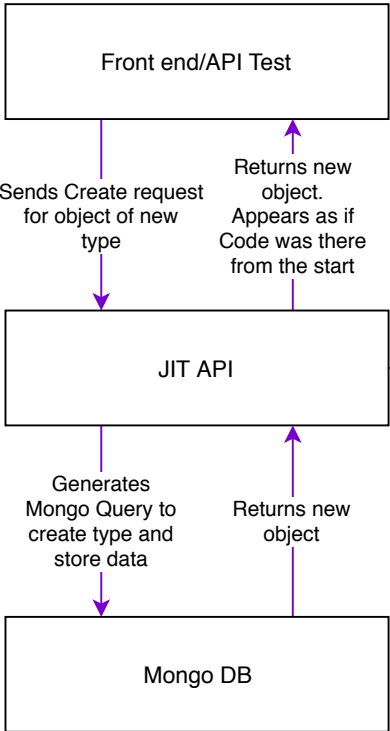

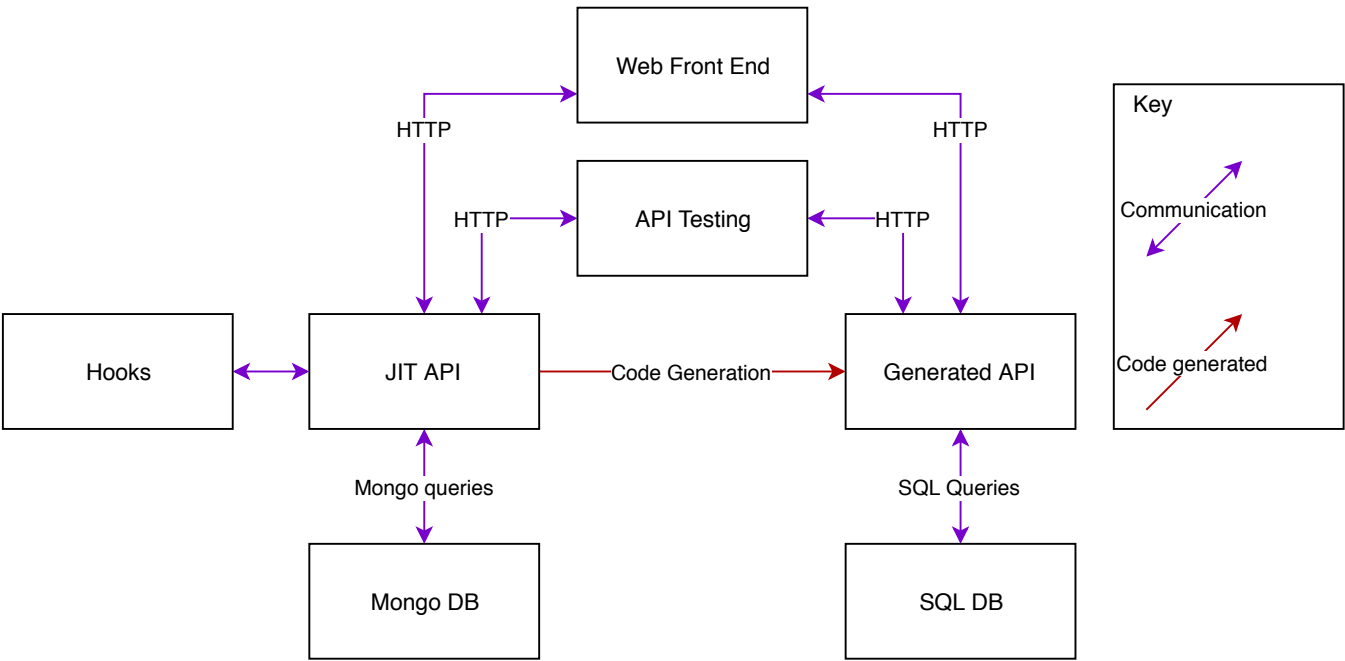

JIT API

The JIT API takes requests from the front end and API tests, makes the appropriate changes in the dev JIT database

Code Generation

The JIT API generates a complete, secure and SQL compatible project

JIT API can then generate a complete project
